User-item (“utility”) matrix

**What are we populating
these cells with?**

	user	item							
John	1	3			5		5		
Erica		5		2		4		5	
Anne	5	2		1		4			2
Liz	3		4	3	4		5		
Jim	5	2		1		4		3	1

Explicit feedback

Likert-scale rating (1-5)
Liked or not (boolean)

Implicit feedback

Browsing behaviour
Purchased? Read? Watched?

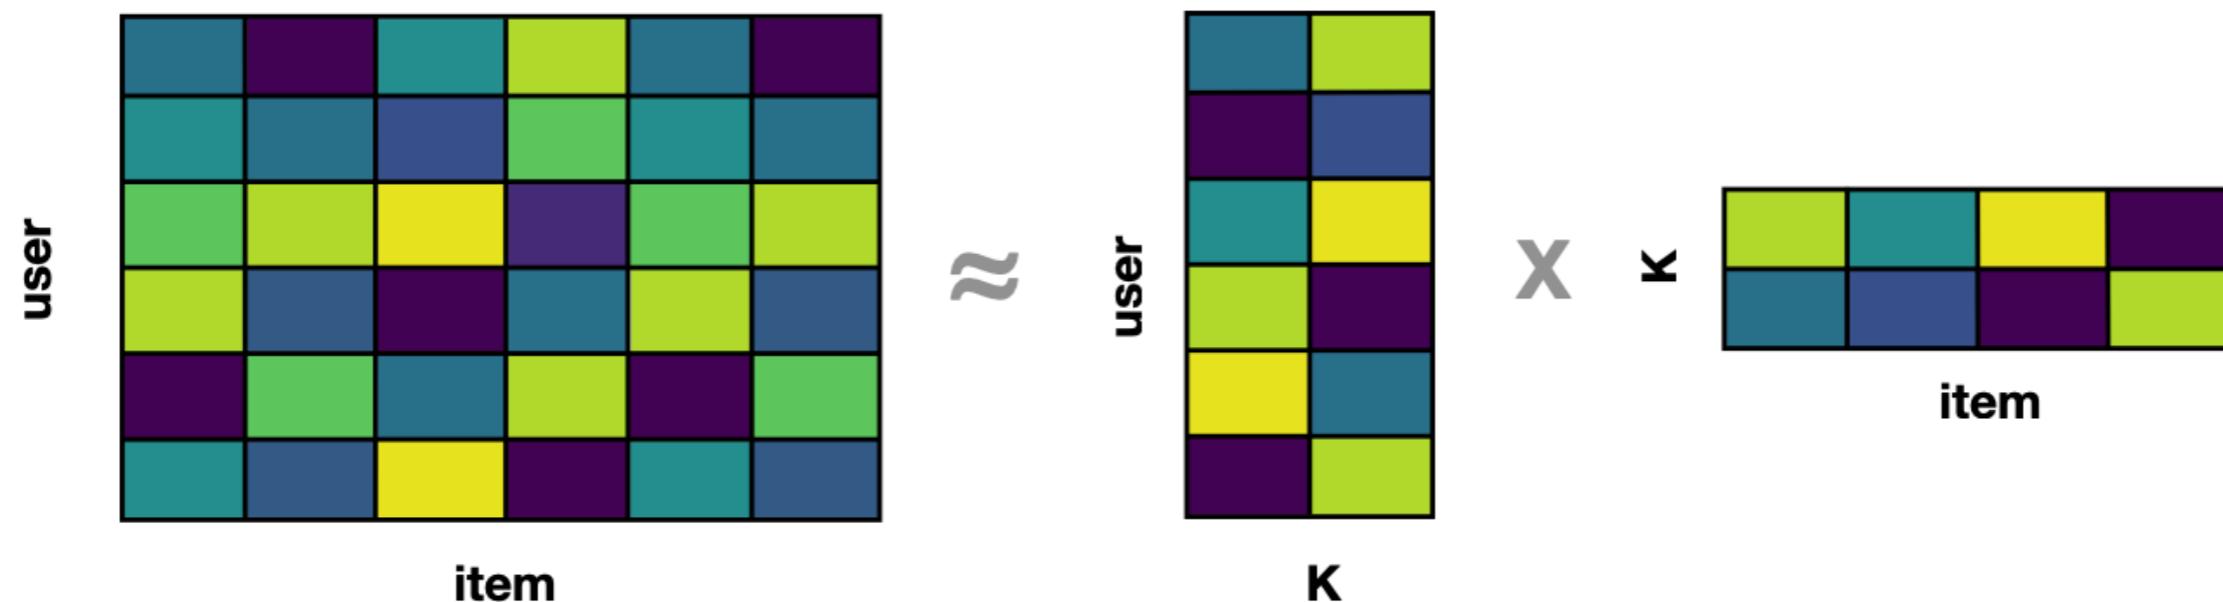

Developing a user feedback score

- Dwell time
- Recent vs. old interactions
- Negative implicit feedback
- What behaviour are you trying to drive?

Matrix Factorization

- Dimensionality reduction
- Factorize the user-item matrix to get 2 latent factor matrices:
 - User-factor matrix
 - Item-factor matrix
- Missing ratings are predicted from the inner product of these two factor matrices

$$X_{mn} \approx P_{mk} \times Q_{nk}^T = \hat{X}$$

Are We Really Making Much Progress? A Worrying Analysis of Recent Neural Recommendation Approaches

ABSTRACT

Deep learning techniques have become the method of choice for researchers working on algorithmic aspects of recommender systems. With the strongly increased interest in machine learning in general, it has, as a result, become difficult to keep track of what represents the state-of-the-art at the moment, e.g., for top-n recommendation tasks. At the same time, several recent publications point out problems in today's research practice in applied machine learning, e.g., in terms of the reproducibility of the results or the choice of the baselines when proposing new models.

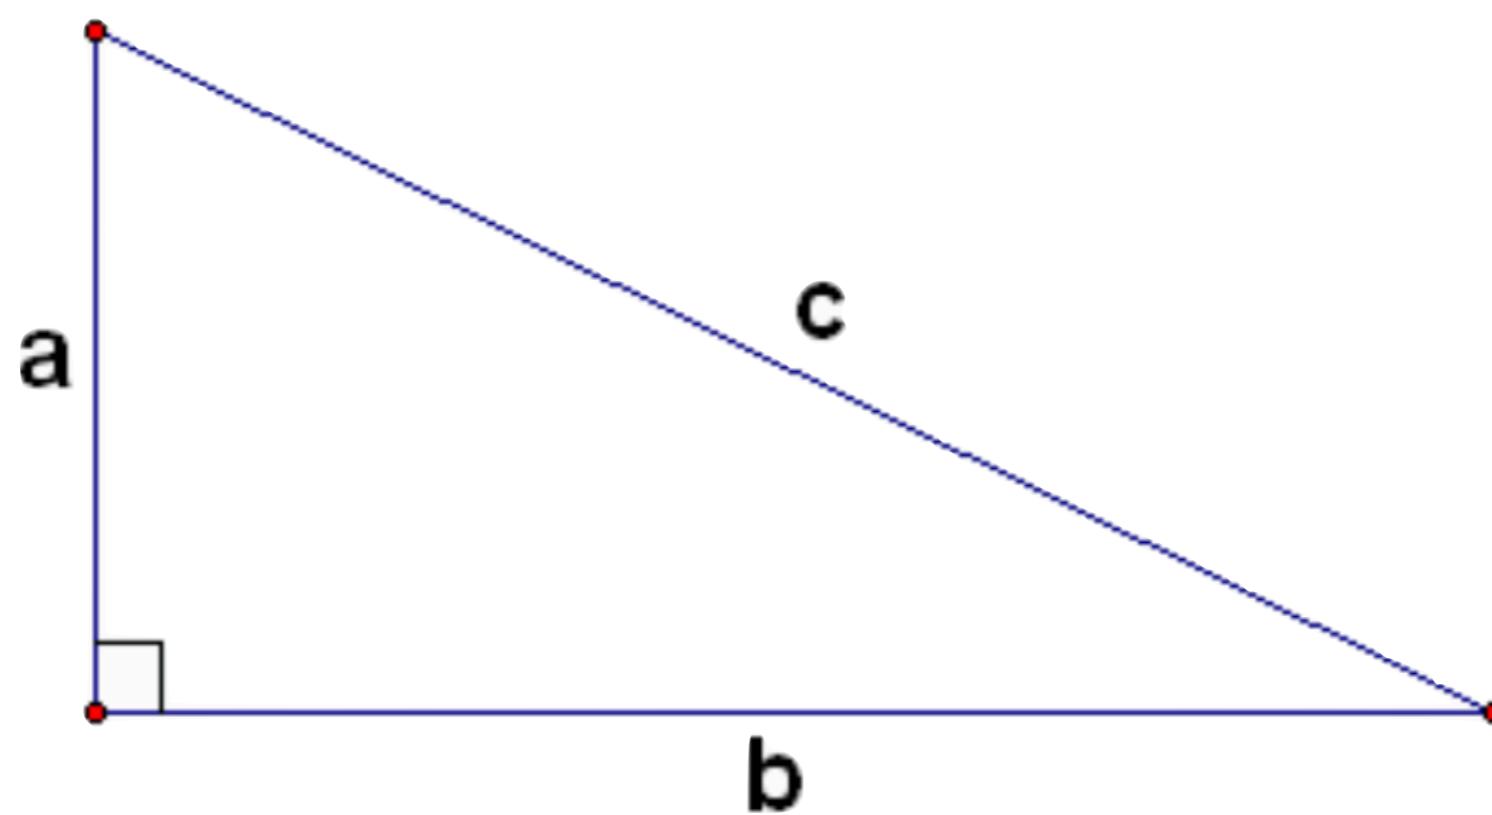

In this work, we report the results of a systematic analysis of algorithmic proposals for top-n recommendation tasks. Specifically, we considered 18 algorithms that were presented at top-level research conferences in the last years. Only 7 of them could be reproduced with reasonable effort. For these methods, it however turned out that 6 of them can often be outperformed with comparably simple heuristic methods, e.g., based on nearest-neighbor or graph-based techniques. The remaining one clearly outperformed the baselines but did not consistently outperform a well-tuned non-neural linear ranking method. Overall, our work sheds light on a number of potential problems in today's machine learning scholarship and calls for improved scientific practices in this area.

1 INTRODUCTION

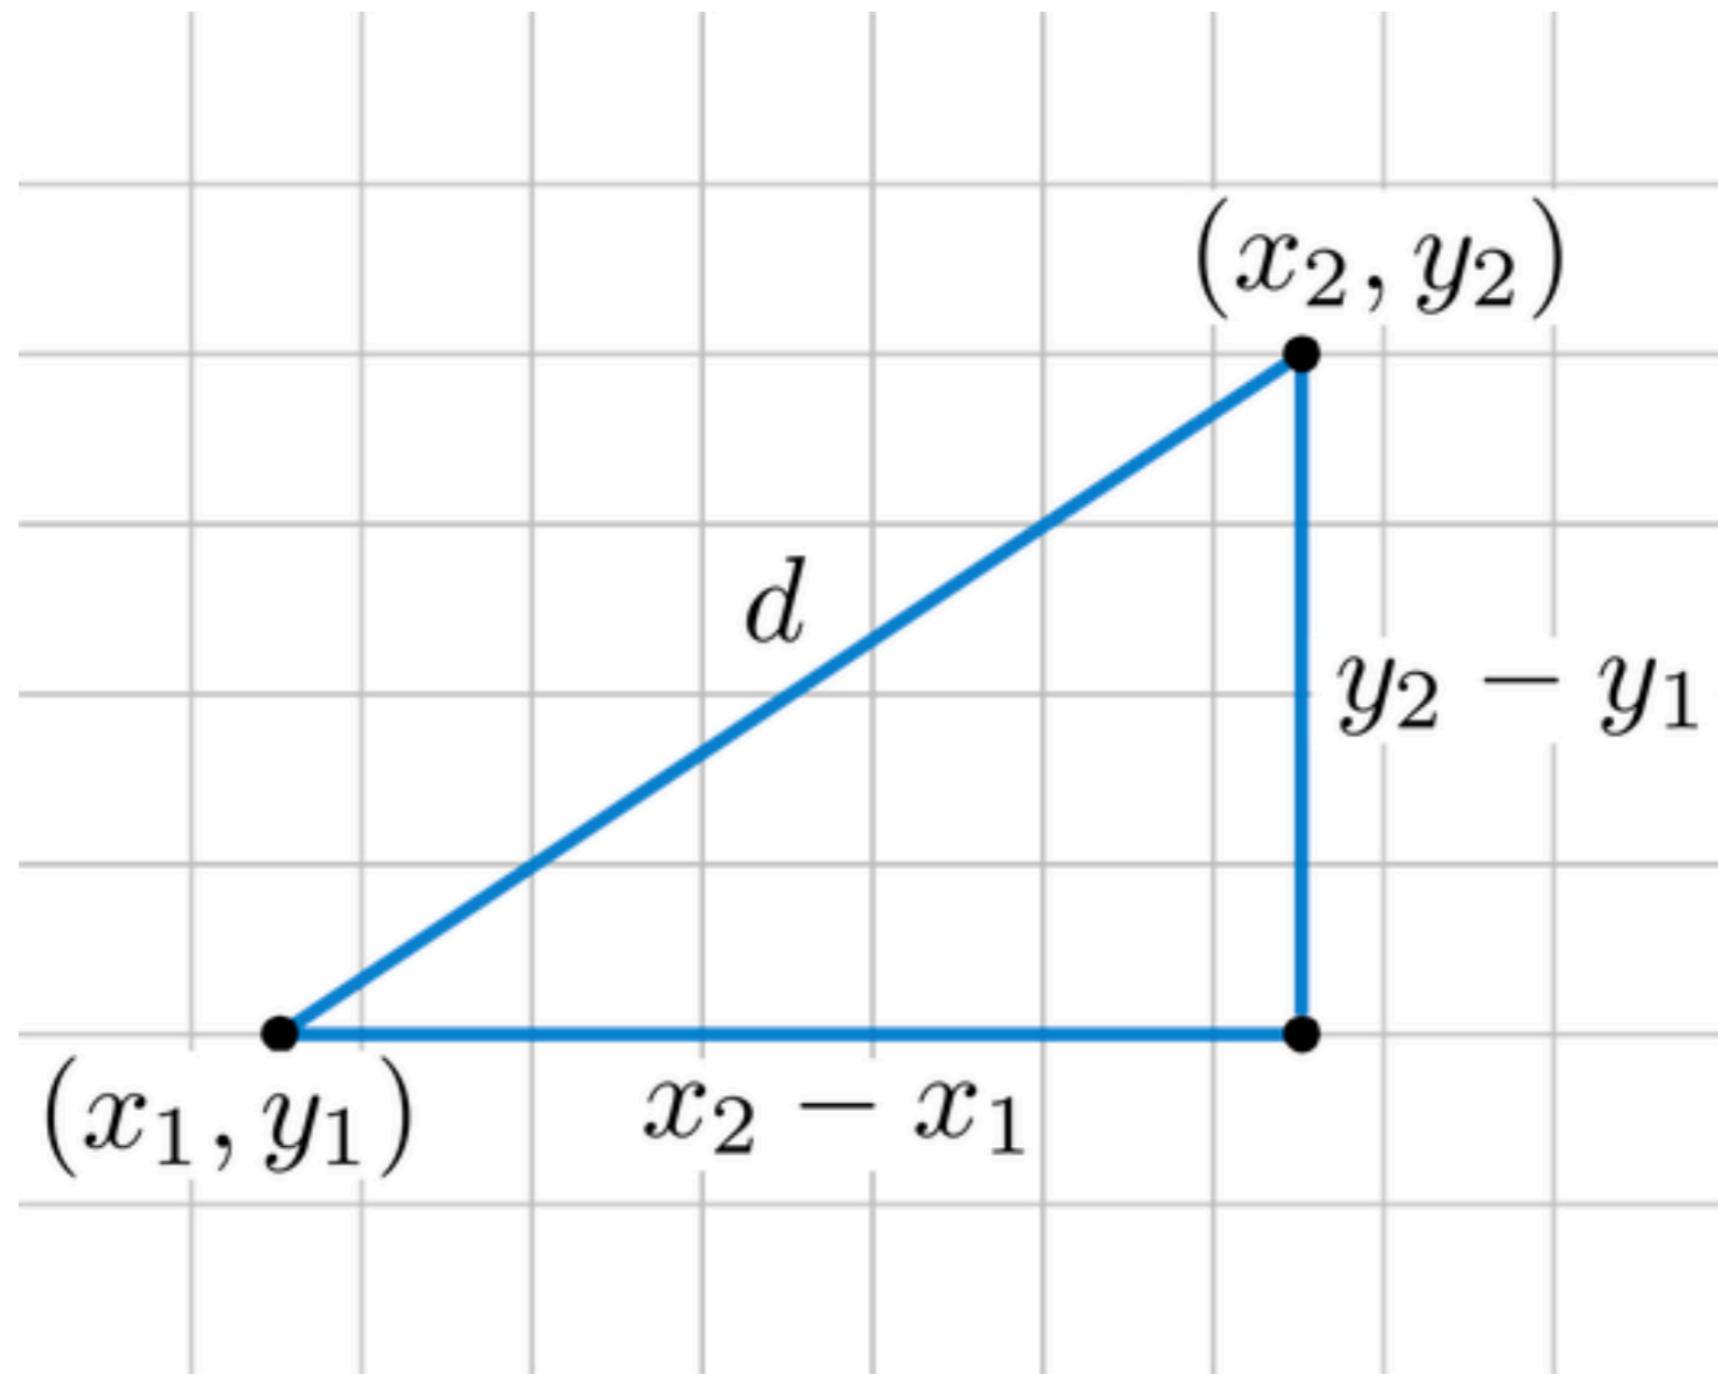

Within only a few years, deep learning techniques have started to dominate the landscape of algorithmic research in recommender systems. Novel methods were proposed for a variety of settings and algorithmic tasks, including top-n recommendation based on long-term preference profiles or for session-based recommendation scenarios [36]. Given the increased interest in machine learning in general, the corresponding number of recent research publications, and the success of deep learning techniques in other fields like vision or language processing, one could expect that substantial progress resulted from these works also in the field of recommender systems. However, indications exist in other application areas of machine learning that the achieved progress—measured in terms of accuracy improvements over existing models—is not always as strong as expected.

Lin [25], for example, discusses two recent neural approaches in the field of information retrieval that were published at top-level conferences. His analysis reveals that the new methods do *not* significantly outperform existing baseline methods when these are carefully tuned. In the context of recommender systems, an in-depth analysis presented in [29] shows that even a very recent neural method for session-based recommendation can, in most cases, be outperformed by very simple methods based, e.g., on nearest-

$$a^2 + b^2 = c^2$$

$$\text{Euclidean distance} = \sqrt{(x_1 - x_2)^2 + (y_1 - y_2)^2}$$

Personal Finance with Python: Using pandas, Requests, and Recurrent Neural Networks

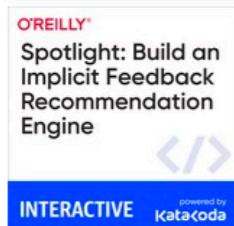

Learn how to use Python to build a personal finance application. You'll learn how to get financial data from the web, calculate formulas in code from scratch, and evaluate and think about money in your day-to-day life. You'll also learn how to mix the two together. In Personal Finance with Python you will learn Python and finance concepts.
